

Documentation and preparation for the Project

Review tasks

Commenting

Note: These tasks apply to both the server and the client

- Add Javadoc comments to all uncommented methods
- Add comments to all unintuitive/non-trivial hacks we've used so far

Code

- Format and indent the code (Some editors, like Textmate, do this automatically). Ideally, 1 tab or 3 spaces.
- If possible, remove unreachable code. Examples:

```
If (false){  
    // This block NEVER executes  
}  
  
Function foo (){  
    //do stuff  
    return;  
    //code after return does not execute  
}
```

- Simplify code that can be simplified. As an example:
 if(age == true)
 Is the same as
 if (age)

Modules

- Removed unused modules
- Remove all testing files from the production binaries

Misc.

- Create the following guides:
 1. SSH'ing to the server
 2. Compiling for Android and iOS

3. Bugfixing with Ionic Serve
 4. Adding/removing libraries/modules from a project
- Document all risk log items/goals that have not yet been completed or have been postponed
 - Explore Jira to see what interesting graphs we can use for the project review
 - Use the Javadoc to create a PDF report containing API calls

Git

- Delete all branches except the main one
- Transfer ownership of all repositories to AJ
